Let's Start!

Data Warehouse

Learning Outcome:

Describe common activities at work to a visitor using short sentences in familiar spoken and written situations.
Understand information about data and its structure in simple spoken and written situations.

Can Do Statements:

- I can explain what a data warehouse is.
- I can explain how a data warehouse works.
- I can identify important information related to data warehouses.

Ask your partner:

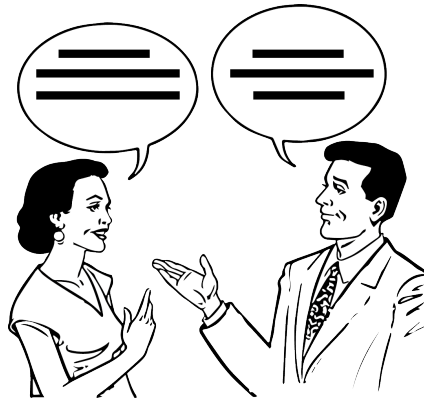

- In your opinion, how can a company store massive quantities of data?
- Do you know any tools to store data? Which ones?

Let's Explore!

Understanding Data Warehouse

Instructions: Read the text below.

Johanna: Hi, Samuel.

Samuel: Hi! Johanna. How can I help you?

Johanna: Well, I have to start working on the data warehouse, but I don't have any idea about that.

Samuel: I know everything related to the data warehouse, but I don't know if I'm able to explain it in an appropriate way. You know, I'm not good at it.

Johanna: Don't worry; I really appreciate your help.

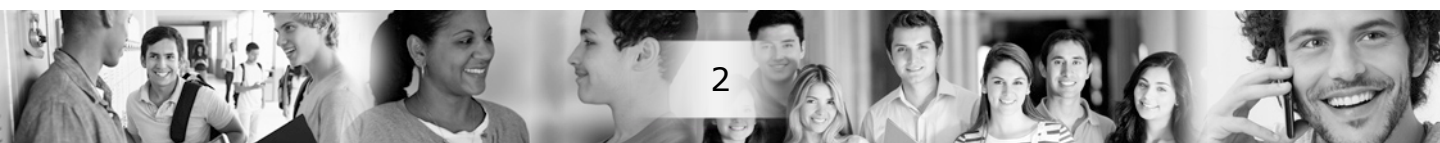

Samuel: Ok, let me tell you what I know. A data warehouse is a database that companies implement for analytical processes instead of real-time business operations. Modern organizations are able to organize their data in a data warehouse because it works with extent queries, and it helps us understand information at any time in a company. For example, our organization's data is stored in a data warehouse.

Johanna: Ok, what about its features?

Samuel: The data warehouse has some features you need to remember: it's subject-oriented, which means you can determine data by the subject; integrated, so the information appears in a uniform format; time variant, which is why we are able to use information in specific periods of time; and non-volatile, since its information cannot change once it is entered. Managers' decisions are based on the information entered in the data warehouse. For example, modern organizations store a huge amount of data in the form of transactions that become database records for further analysis.

Johanna: Is there any other important information?

Samuel: Yes! You need to be able to work with the three different types of data warehouses that exist. One is related to information processing; it basically treats information by statistical analysis. I mean, it analyses charts or graphs. The other one is about analytical processing: it seconds the analytical processing of information by implementing analytical operations. The last one is data mining: it can discover information by finding hidden patterns.

Let's Practice!

You need to know these types of data warehouse

Instructions: Read the sentences. Write the missing word(s) in the blank. Use: can analyze, be able to work, can find, is able to process.

To use data warehouse, you need to _____ with the three different types of it. First, there is one that _____ statistics, it examines charts and graphs. The second one is able _____ information through analytical operations. The last one _____ hidden patterns and this allows you to discover certain information.

Let's Practice!

Is data warehouse useful for your organization?

Instructions: Use the words from the Word Bank to complete each sentence.

Word Bank

organizations' / companies' / warehouses'

Some _____ data is stored in databases like data warehouses. This _____ information is used to analyze and understand the _____ decisions according to the results of these analysis.

Extension Activity

Let's find out more about data warehouses!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for a data warehouse on the internet.
- Study all the information on the website.
- List all the features you can find on there.
- Write a mail to a friend letting him/her know everything you found on the website.
- Share the mail with a classmate.

Self-Assessment

Yes No

- I can look for specific information on the internet.
- I can list specific features.
- I can write a mail describing what I found.

☐ ☐
☐ ☐
☐ ☐

Target Words

- data warehouse** (noun): a database designed for analysis
e.g. Well, I have to start working on the data warehouse, but I don't have any idea about that
- manager** (noun): a person in charge of a business
e.g. Managers' decisions are based on the information entered in the data warehouse.
- hidden** (adjective): that is not visible
e.g. The last one is data mining: it can discover knowledge by finding hidden patterns; this one can show findings in visual versions.
- second** (verb): to support
e.g. Another one is about analytical processing: it seconds analytical processing of information by analytical operations.
- uniform** (adjective): that is consistent
e.g. In simpler words, you can determine data by subject, information appears in a uniform format.
- real time** (noun): something that happens in actual time
e.g. A data warehouse is a database created for analysis; it's not for real time business operations.

Learning Points

Be able to and Can

You use **be able to** and **can** to talk about actions that you perform according to your abilities.

Notice that the only difference between them is that **be able to** is more formal than **can**.

To create a statement using **be able to**, follow the next structure.

Subject + Verb to be + Able to + Verb + Complement

Example:

*I **am able to** explain everything related to data warehousing.*

To create a statement using **can**, follow the next structure:

Subject + Can + Verb + Complement

Example:

*I **can** work with data warehouses.*

Examples

- *Modern organizations are able to organize their data in a data warehouse because it works with extent queries, and it helps understanding information at any time in a company.*
- *You need to be able to work with the three different types of data warehouses that exist.*

Learning Points

Possessive Forms

You can use possessives to indicate that something belongs to the person or object in a sentence.

We use **possessive's** to indicate possession. Place this particle at the end of the subject that possesses the noun you are talking about.

For example:

The **teacher's notes** about data warehouse are very useful. (The notes belong to the teacher. *Teacher* carries the **'s**)

If the owner is singular, use the possessive 's at the end of the subject.

Example:

The **company's** data warehouse is really huge.

If the owner is on its plural form use (') after the plural s of the subject.

Example:

You have to enter the **employees'** transactions to the warehouse daily.

Examples

- *Our organization's data is stored in a data warehouse.*
- *Managers' decisions are based on the information entered in the data warehouse.*
